2 OCI Diagram	11-15
3 ERD diagram	16
4 Activity Diagram	17-24
5 Sequence Diagram	25-33
6 General Use Case Diagram	34

1.Introduction

This document serves as a comprehensive overview of the Library Management System (LMS), This project manages and stores book information electronically according to user's needs. The system helps both users and library manager to keep a constant track of all the books available in the library. It allows both the admin and the users to search for the desired book. an Advanced software solution designed to streamline the operations of libraries and enhance user experiences. This system aims to automate various library processes, including management, user registration, circulation management. The library system facilitates efficient management of library resources.

This document outlines the system's Requirements (functional and nonfunctional), System architectural design and model (class, ERD, use case, activity and sequence, diagrams), technologies used. It is intended to provide valuable insights for stakeholders, including library administrators, staff, and system developers, guiding them through the system's functionalities, interfaces, constraints, and response mechanisms.

Advantages

The system excludes the use of paperwork by managing all the book information electronically.

Admin can keep updating the system by providing the new books arrival in system and their availability thus Users need s.

The system has books well organized and systematically arranged in different categories in the system so that the user can easily search and find the book.

Thus, it saves human efforts and resources.

User Interface Design:

- The user interface is designed to be user-friendly, and accessible.
- It focuses on simplicity, efficiency, and accessibility to users with diverse needs.

Technologies Used:

- i. Frontend: -Html, CSS, JavaScript, Bootstrap.
- ii. Backend: - Java spring Boot framework.
- iii. Database: - MySQL.

2.System Requirements specifications

- **Functional Requirements**

The LMS must have the following functional requirements:

- The LMS should store all information about librarian and other users (Users and Admin) like their login info, books etc.
- The LMS should store all information about the books and users in two separate Tables.
- The admin must be able to add/remove/manage books, users, category.
- LMS system provides suggestions for the user depending on the user's books have been read.

Users shall be able to: -

- Create an account.
- Login the system.
- Logout from the system.
- Update their profile information (name, password, etc...)
- Delete their account.
- Add book to cart.
- pay by credit card.
- export the payment billing.

-listening to eBook.

Admin shall be able to: -

-login.

-logout.

-Create account.

-update profile.

-Add user.

-Delete user.

-Add category.

-Delete category.

-Add Book.

-Update Book.

-Delete Book.

• Non-Functional Requirements

The system is going to be exposed to large traffic. There can be a huge number of requests at the same time at the system and it should tend to respond to all requests in real-time experience. Also, the system should respond with minimum latency, a user should never wait too much time to get the response

as this is a real-time system experience. To illustrate this, when you search for a video in the system, this system should suggest related videos as soon as possible. The system shall be cost effective, stay consistent and reliable, which means there should not be any data loss. Additionally, service will be durable which means all piece of system should exists until they are

Usability Requirements:

- Our user interface should be interactive, simple and easy to understand. The system should prompt the user and administrator to login to the application for proper input criteria.

Security Requirements:

- System should use secure Database.
- Normal users can just read information, but they cannot edit or modify anything except their personal and some other information.
- System will have different types of users and every user will have access constraints.
- Proper user authentication should be provided.
- No one should be able to hack user's password.
- There should be separate accounts for admin and members such that no member can access the database and only admin has the right to update the database.

Availability

- The site is available for users 24/7.

- Pages that may experience problems must display a notification with a timer showing when the system is going to be up again.

Performance Requirements

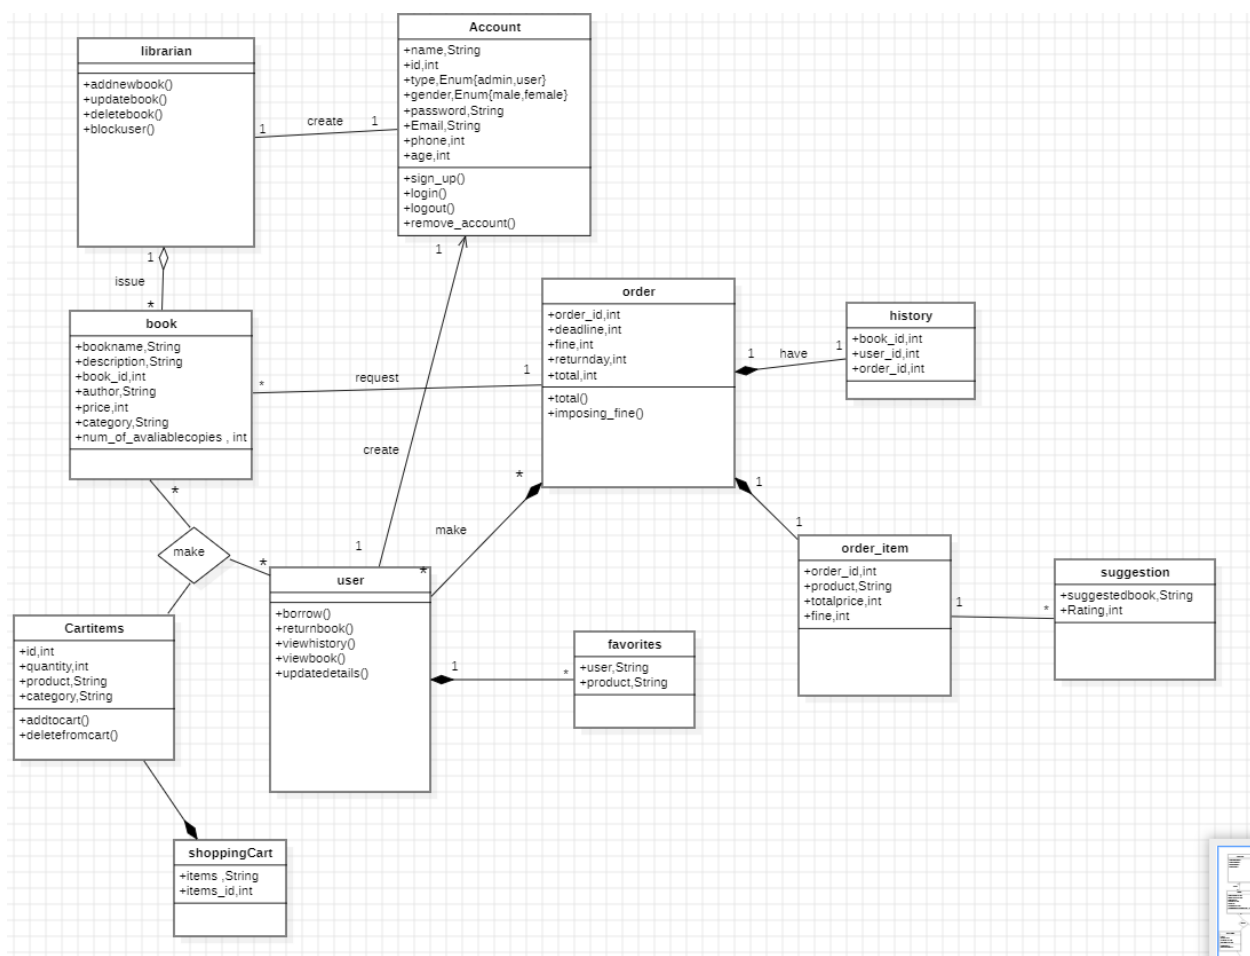

- The system shall accommodate a high number of books and users without any fault.
- Responses to view information shall take no longer than 5 seconds to appear on the screen.

Maintainability

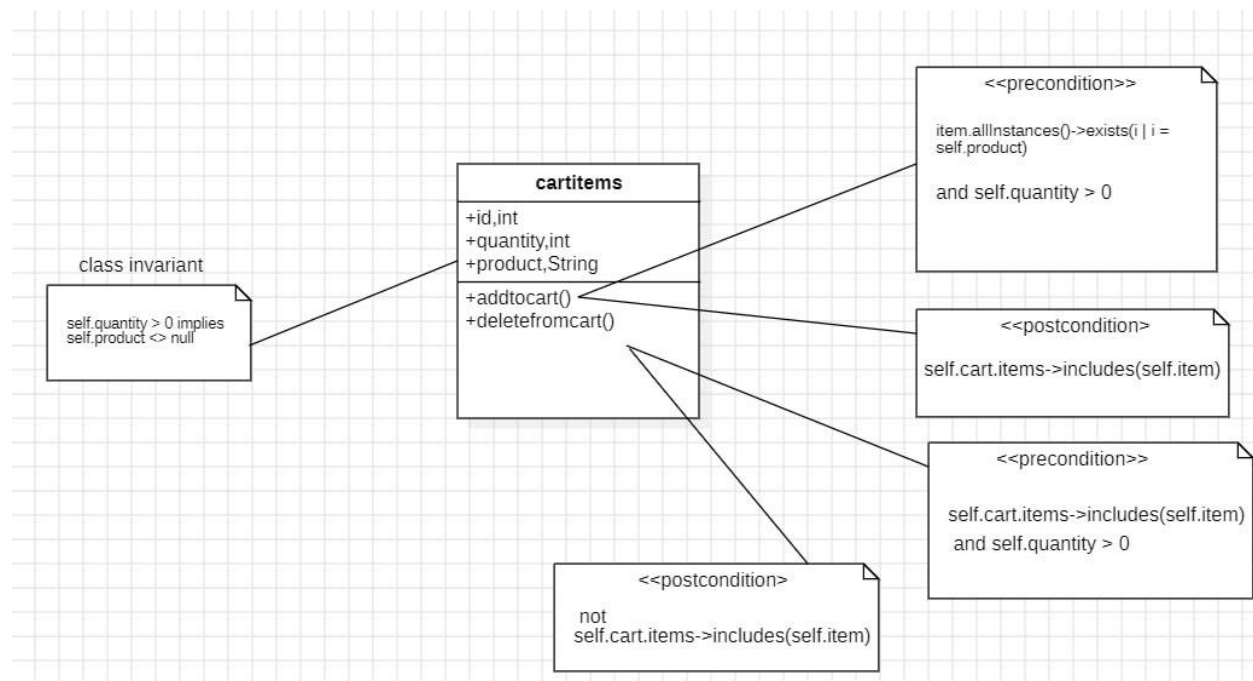

The developers, database administrators and a team of software engineers work on the maintenance and the site.
